

WASHINGTON STATE FUSION CENTER

CORONAVIRUS FACT SHEET FOR ELECTION WORKERS

BASIC FACTS

WHAT IS A CORONAVIRUS?

Coronaviruses are a large family of viruses which may cause illness in animals or humans. In humans, several coronaviruses are known to cause respiratory infections ranging from the common cold to more severe diseases such as Middle East Respiratory Syndrome (MERS) and Severe Acute Respiratory Syndrome (SARS). This most recently discovered coronavirus causes coronavirus disease 2019 (COVID-19).

WHAT IS A COVID-19?

Coronavirus disease 2019 (COVID-19) is the infectious disease caused by the most recently discovered coronavirus—severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). This new virus and disease were unknown before the outbreak began in China, in December 2019.

INCUBATION AND SYMPTOMS

The “incubation period” means the time between being infected with the SARS-CoV-2 virus and beginning to have symptoms of the disease. Estimates of the incubation period for COVID-19 range from 1-14 days. The most common symptoms of COVID-19 include:

- Fever
- Dry cough
- Nasal congestion
- Sore throat
- Diarrhea
- Difficulty breathing

VIRUS TRANSMISSION

INFECTIOUS PERIOD

The infectious period is unknown, but possibly up to 10-14 days. People are thought to be most contagious when they are most symptomatic (the sickest). Some spread might be possible before people show symptoms; there have been reports of this occurring with this new coronavirus, but this is not thought to be the main way the virus spreads.

HOW DOES IT SPREAD?

- Via respiratory droplets produced when an infected person coughs or sneezes.
- Between people who are in close contact with one another (within about 6 feet).
- It may be possible for a person to get COVID-19 by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes, but this is not thought to be the main way the virus spreads.

STAY INFORMED

PREVENTION AND TREATMENT

There is currently no vaccine to prevent COVID-19. Most people with mild coronavirus illness will recover on their own by drinking plenty of fluids, resting, and taking pain and fever medications. The CDC recommends everyday preventive actions to help prevent the spread of respiratory diseases, including:

- **Stay home when you are sick.**
- **Avoid close contact with sick people.**
- **Avoid touching your eyes, nose, and mouth.**
- **Cover your cough or sneeze with a tissue, then throw tissue in the trash.**
- **Clean and disinfect frequently touched objects and surfaces using EPA-registered cleaning sprays or wipes following the directions on the label.**
- **Washing hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.**
- **Wear gloves while handling ballots and envelopes. If a glove tears, remove gloves, wash hands, and put on new gloves before returning to work. Workers should not touch clothes or skin with hands while wearing gloves.**
- **If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol.**
- **Facemasks should only be used by people who show symptoms of COVID-19 to help prevent the spread of the disease to others.**
- **Agencies may want to consider restricting travel to areas with known outbreaks—as well as suspending participation in conferences and other large gatherings domestically.**

This coronavirus fact sheet was coordinated with and reviewed by the Washington State Department of Health.
